Service Provider Foundation

Modern IT footprint spans multiple environments

On-premises datacenter

Remote office/branch office

Hybrid & multi-cloud

Windows Admin Center provides granular management anywhere

Lightweight, browser-based, remote management

Great for troubleshooting, configuration, maintenance

Connect to and manage a single server/cluster at a time

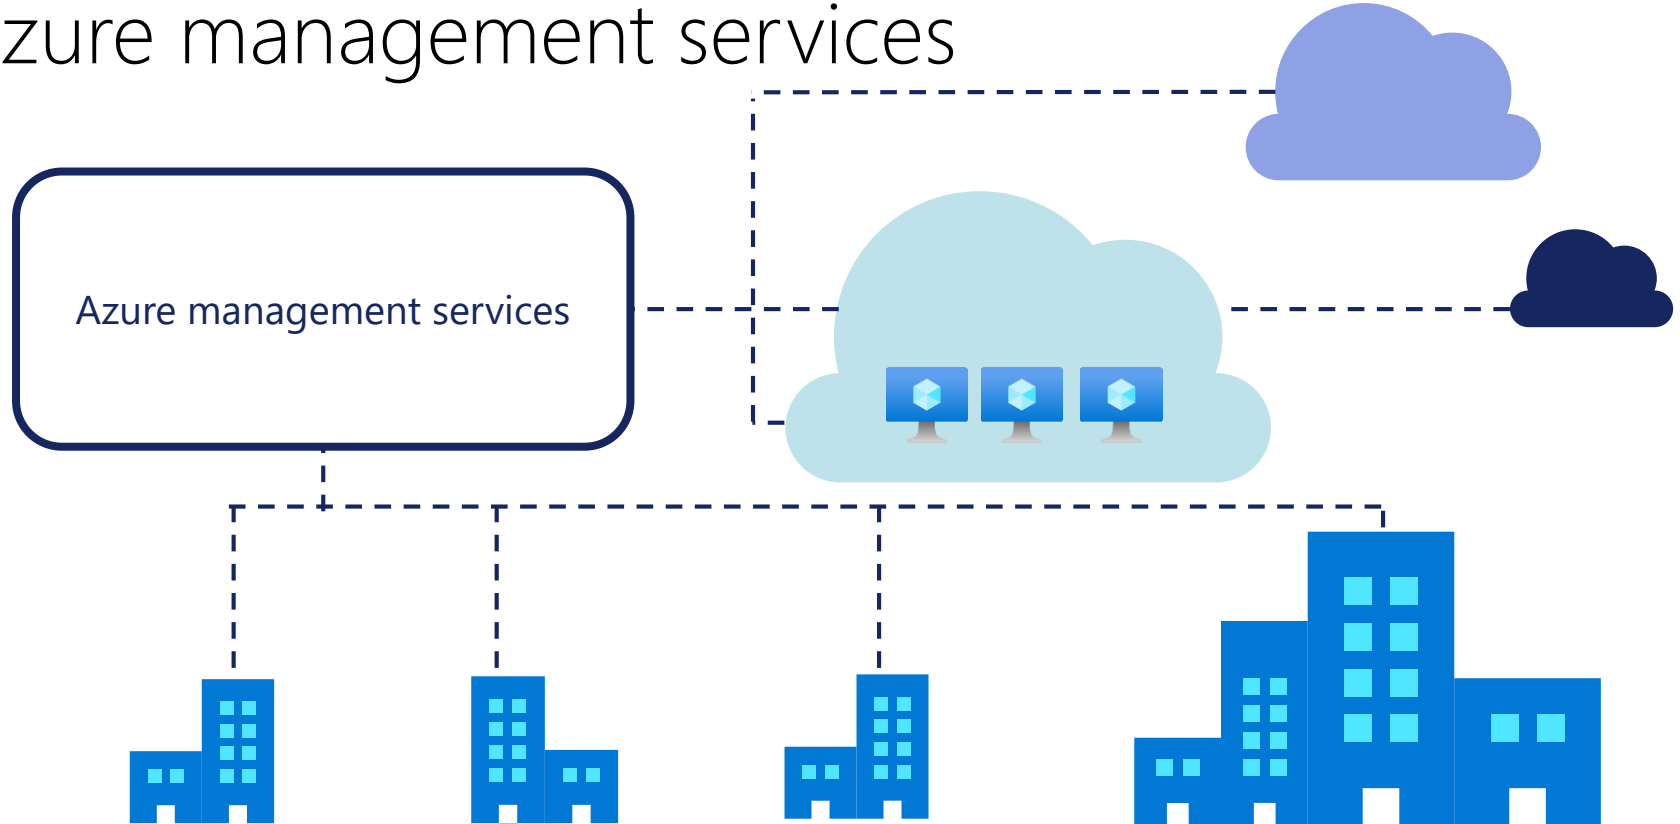

System Center provides datacenter management at scale

Datacenter management:
Monitoring, Config Mgmt,
Provisioning, Automation

Windows Server
management at scale,
custom monitoring (MPs)

Centralized management with Azure management services

Azure provides robust centralized management without the on-premises footprint

Azure management services

Remove dependency on additional hardware footprint to monitor your environment

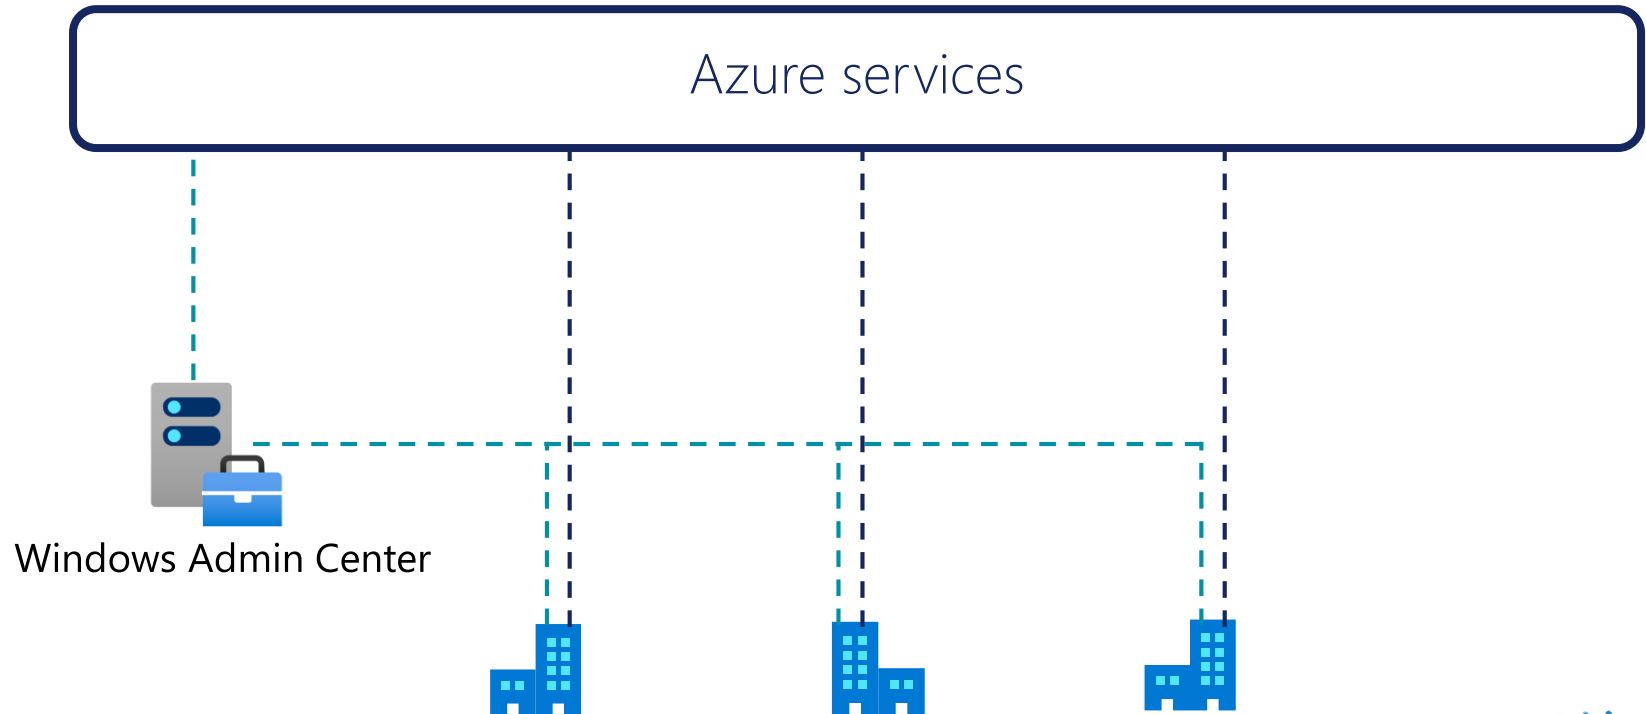

Only pay for what you want/need

See your on-premises and Azure resources in one place in the Azure portal; manage your entire estate of server instances, anywhere

Windows Admin Center + Azure services

Windows Admin Center streamlines setup and configuration for your on-premises servers

Extend on-premises into Azure

Business continuity & disaster recovery

Windows Admin Center + System Center

Windows Admin Center

Reimagined "in-box" platform & tools

Included with Windows Server license – **no additional cost**, just like MMC and other traditional in-box tools

Lightweight, browser-based remote management of Windows Server instances, **anywhere**; alternative to RDP

Deep single-server & single-cluster drill-down for troubleshooting, configuration & maintenance

Optimized management of **individual** 2–4 node **HCI** clusters, integrating Hyper-V, Storage Spaces Direct, and SDN

Monitoring on HCI only; cluster health service stores history. Extensible platform for 1st and 3rd party **admin tool extensions**

Easiest bridge to **hybrid**; onboard and use a variety of Azure services for data protection, replication, updates and more

Lights up platform features of Windows Server: Storage Migration Service, Storage Replica, System Insights, etc.

System Center

Datacenter management & monitoring

Comprehensive suite of solutions for additional value across your environment and platforms

Manage & monitor **heterogeneous** systems **at scale**, including Hyper-V, VMware, and Linux

Infrastructure provisioning; automation and self-service; infrastructure and workload monitoring **breadth**

Deploy & manage Hyper-V, Windows Server clusters at **datacenter scale** from **bare metal** with SCVMM

Extensible & scalable monitoring platform in SCOM, with alerting, notifications, third-party workload monitoring; SQL for history

Built-in data protection, replication, updates (DPM/VMM/SCCM). Hybrid integration with Log Analytics and Service Map

Additional platforms: Automation in Orchestrator/SMA. Integrations with SCSM & other service management tools

Each delivers targeted value independently; **better together** with complementary capabilities

Connection

Azure Log Analytics Overview

Introduction

Operations Manager can be connected to Azure Log Analytics as an Attached Service, which will allow you to collect machine data from your SCOM environment and analyze it in the Azure Log Analytics.

Azure Log Analytics is an IT management solution that provides real time operational intelligence across hybrid environments. Azure Log Analytics can collect log data from your environment and analyze it in order to help you separate signal from the noise.

Get Started:

[Register to Azure Log Analytics](#)

Connect your SCOM management group to an existing Azure Log Analytics workspace

System Center release cadence

Long-Term Servicing Channel (LTSC) releases

- 2–3 years—vNext
- 5 years mainstream support + 5 years extended support
- Focus on Windows Server LTSC support

Update Rollups (UR) for LTSC

- Every 6 months
- Bug fix releases

Orchestrator

Orchestrator 2019

- 64-bit support
- PowerShell v4 +
- SQL 2017
- Support for TLS 1.2

Process Automation

Orchestrate processes using graphical, PowerShell, and Python runbooks

Configuration Management

Collect inventory

Track changes

Configure desired state

Update Management

Assess compliance

Schedule update installation

Azure Functions

Event driven, compute on-demand, events occurring in Azure, third-party, or on-premise systems

Heterogenous

Windows & Linux

Azure and on-premises

Service Manager

Service Manager 2019

- Improved UI responsiveness
- AD connector improvement
- SQL 2017
- Support for TLS 1.2

Service Catalog

Build and deliver turnkey applications to your enterprise IT customers

Azure Policy

Enable security and management at scale for Azure resources

Azure Blueprint

Service Management in a Hybrid World

IT Service Management Connector

Microsoft

IT Service Management Connector

Microsoft

Create

Save for later

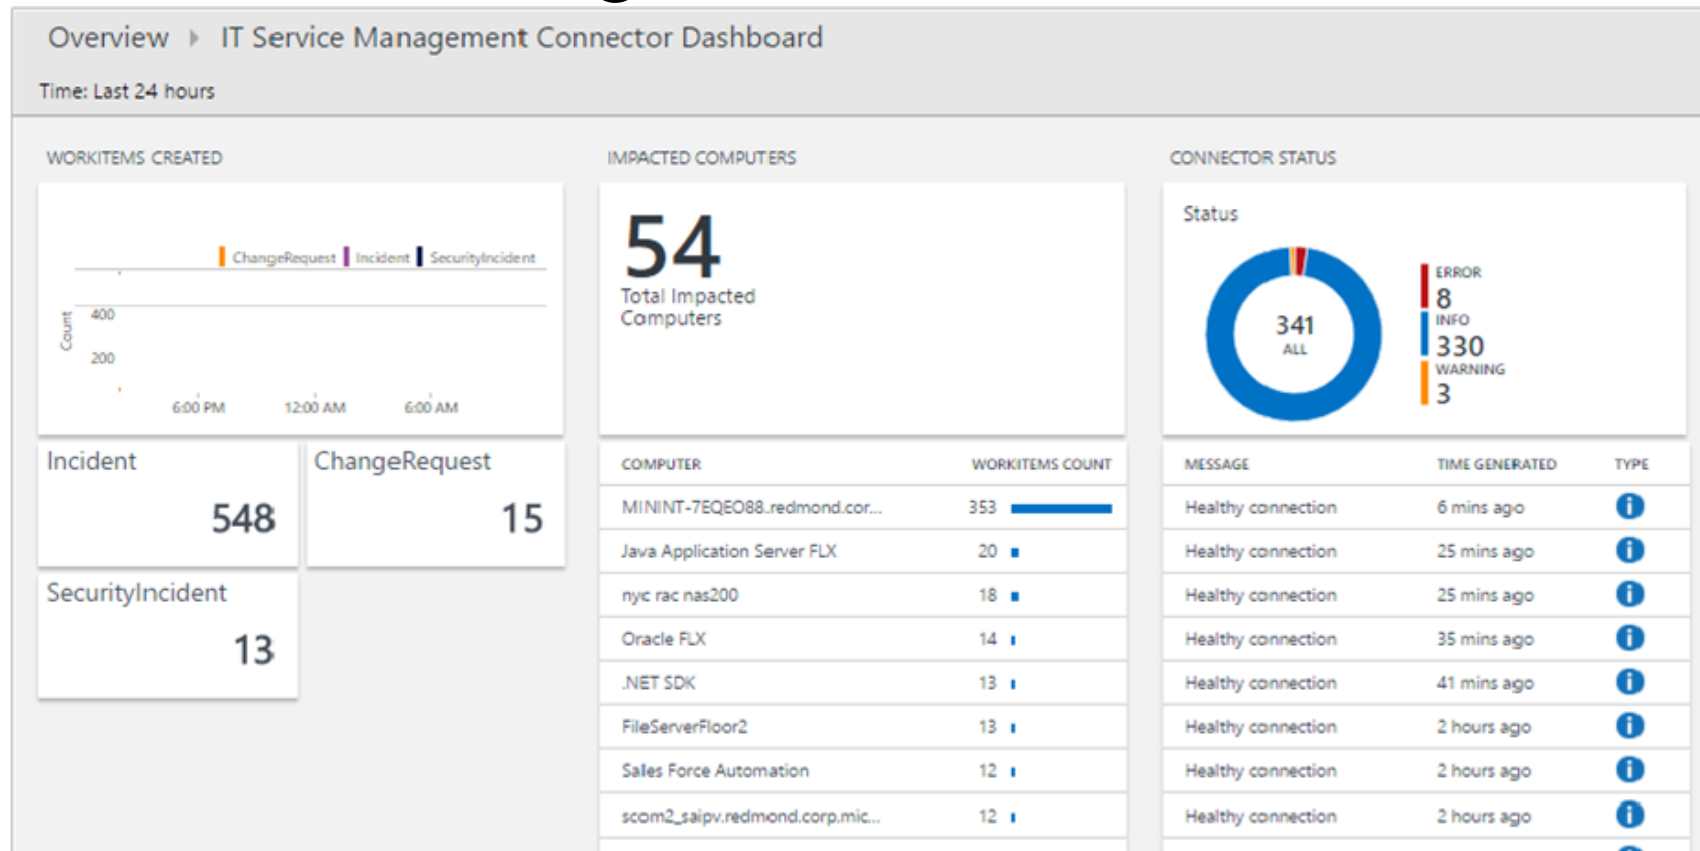

The IT Service Management Connector Solution enables you to provide faster resolution of incidents by bringing service desk and monitoring data together. It provides a bi-directional connection between Azure and supported ITSM tools : ServiceNow, System Center Service Manager, Provanance and Cherwell.

With this solution you can:

- Create an incident (or event/alert) in your service desk solution based on alerts from Azure (activity log alerts and near real-time metric alerts in Azure Monitor and Azure Log Analytics alerts) or log records in Azure Log Analytics.
- Sync incident data from your service desk solution with Azure Log Analytics and correlate with relevant log data
- Sync change request data from your service desk with Azure Log Analytics and correlate the change request data with Change Tracking solution of Operations Management Suite
- See your service desk incidents against affected resources in Service Map solution of Azure Log Analytics

After installing the solution, you will need to create a connection that links to your ITSM tool.
